LANGUAGE: English
SUMMARY LANGUAGE: English
AB The recognition of molecular control elements which govern cell and organ
function is essential for the development of novel **drug**
therapies and for an understanding of **drug** actions. Thus, a
major interest is focused on methodologies which permit the
identification of novel control elements. This is of particular
relevance for the **identification** of **drug** targets, the
distinction of **target** isoforms, the differentiation of
signalling pathways, the generation of disease models and toxicological
testing. In this review, we discuss different classes of genetically
modified animals and their potential to elucidate biological processes
relevant for pharmacological research including functional genomics.
Techniques which permit the time- and tissue-specific **inducible**
regulation of **gene expression** present an important
methodological advance. Copyright (C) 1999 Elsevier Science B.V.
